

GOLDCLIFF STAKES 15,350 HECTARES-DISCOVERS 21 GRAMS GOLD AND 1715 SILVER

(Vancouver, Canada), Goldcliff Resource Corporation reports staking 31 claim blocks (15,350 hectares) for the Plug Project in the Merritt-Logan Lake gold belt, British Columbia, Canada. The claims cover 26 stream sediment gold anomalies, 10 stream sediment gold anomalies are strongly anomalous in gold, with values of 185 to 765 ppb gold. On the claims, two gold-silver discoveries contain 20.78 grams/tonne gold (g/t) and 1715.0 g/t silver.

Goldcliff's Plug and Meadow gold-silver discoveries on the claims are highlighted by 20.78 grams/tonne gold (g/t) and 1715.0 g/t silver. These discoveries are located up-stream from strongly anomalous gold stream sediments. Goldcliff's Plug Project stream sediment survey is a follow-up to the BC Government RGS stream sediment sampling survey.

Goldcliff's stream sediment sampling survey consisted of collecting 55 stream sediment samples along various drainages in the Merritt-Logan Lake gold belt. The sample results identified 26 gold stream sediment anomalies ranging from 10 to 765 ppb gold, ten of which are strongly anomalous in gold values ranging from 185 to 765 ppb gold. Two of these gold anomalies identified the Plug and Meadow showings. The remaining 24 gold stream sediment anomalies require follow-up exploration.

The Plug Project Merritt-Logan Lake gold belt is situated just east of Almaden Minerals Ltd.'s newly-discovered Spences Bridge-Merritt gold camp. In 2005, the Spences Bridge-Merritt gold camp was discovered by Almaden Minerals Ltd as a result of anomalous gold stream sediment values. Almaden's stream sediment survey discovered elevated gold values in stream sediments, reportedly in the range of 2 to 14 ppb gold. The follow-up prospecting of the anomalous gold sediment anomalies resulted in the staking of claims. The prospecting of these anomalous gold sediment anomalies resulted in the discovery of several showings that contain gold mineralization. One of which is the Skoonka Creek gold showing that has returned 20.2 g/t gold.

The Merritt-Logan Lake gold belt lies within the Intermontane Belt of the Canadian Cordillera, which is underlain by the Triassic volcanic and sedimentary rocks of the Nicola Group. The Nicola Group is a complex combination of volcanic and sedimentary rocks. A variety of igneous rocks intrude the complex.

The Plug Project claims contain 24 stream sediment gold anomalies that require follow-up prospecting and exploration. In 2006, Goldcliff plans to carry out a program to evaluate these gold anomalies.
